

Inventory (plug-in)

Usage:

- Complete hard and software inventory per user at a click of a mouse
- Rapid verification of software used in the company
- Localisation of non-authorized software
- License summary at all times with sufficient or deficient cover
- Easy determination of decision-making bases, for example for migrations
- Direct online requests on the network
- Reports for visualization and further processing
- Overview of all soft and hardware changes (Delta)
- Definition of queries as projects with continuous updating of data.

The result:

Visualization of current and comprehensive IT inventory for hard and software with only a few mouse clicks. The inventory is based on the scanning principle that also allows identification of software installed by the user. In addition to that, your inventory is always based on real values.

Easy control through the management console

highsystem.NET IT inventory is completely integrated into the highsystem.NET management console. Due to this fact, all necessary information can easily be obtained in the usual environment with just a few mouse clicks.

Your IT project based on inventory data

Whether 20, 200, 2'000 or more PCs, with a click on your mouse, you can obtain comprehensive and selective IT inventory for all major business incidents. This current data is an ideal basis for your IT projects, like for example software rollout, migration to XP or MS Vista. Easy-to-use request options – that can be handled by anyone – provide you with inventory information from the entire system. Therefore, a migration, for example, can be planned and carried out systematically, professionally and based on the current inventory data.

IT requests can be saved and further processed as a project. The option of an installation based on inventory drastically reduces the sources of error and increases the benefit value for every company. In addition to that, inventory data is automatically updated after each activity and, hence, current and complete.

Multiple evaluation and request options

Multiple evaluations are available for you, such as, for example, detailed network documentation with hard and software components. Furthermore, you have various request options that allow you to obtain selective request and planning information. This ensures you the integration and adaptation to each company's individual standards.

Licensing basis

The number of PCs related to the software distribution is decisive.
